Data Consistency Framework

Role & Purpose

Data consistency mechanisms enforce business logic throughout the employee lifecycle workflows. These rules automatically update request status fields, prevent incomplete or invalid data submission, trigger automated lifecycle record updates upon task completion, and respond dynamically to workflow stage transitions.

Strategic Objectives

- Preserve accuracy and reliability of employee lifecycle information
- Enable autonomous request status progression
- Enforce submission data quality standards

Core Mechanisms

- Update request status progression during onboarding/offboarding stages
- Block invalid or incomplete data submissions
- Automatically close lifecycle records upon task completion
- Trigger stage-transition background updates

Success Indicators

- Enhanced data accuracy in lifecycle tracking
 - Automated lifecycle record lifecycle management
 - Minimized manual status tracking intervention
-

Dynamic Form Field Visibility

Framework Overview

UI Policies implement conditional field display mechanisms in onboarding and offboarding forms. Based on user-selected request type, the system displays only contextually relevant fields. This approach minimizes user confusion, prevents erroneous data entry, and optimizes user interface usability.

Conditional Display Logic

- **Onboarding Scenario:** Request Type selection = Onboarding → **Joining Date** field display activated
 - **Offboarding Scenario:** Request Type selection = Offboarding → **Exit Date** field display activated
-

Implementation Process

Phase 1: Form Location

- Navigate to **Service Catalog** → **Catalog Definitions** → **Maintain Items**

Phase 2: Catalog Item Selection

- Locate and open the **Onboard/Offboard Employee** catalog item entry

Phase 3: UI Policy Access

- Scroll to **Catalog UI Policies** related list section
- Initiate new UI Policy creation by clicking **New**

Phase 4: Policy Configuration

Configuration Parameters:

- Applies To: Catalog Item
- Catalog Item Selection: Onboard/Offboard Employee
- Display Title: Show Joining Date for Onboarding
- Trigger Condition: Request Type is Onboarding
- Save the policy

Phase 5: Action Configuration

- Access **UI Policy Actions** from the related list section
- Establish new UI Policy Action by clicking **New**

Action Settings:

- Target Variable: **Joining Date**
- Visibility Setting: **True** (Enabled)

Phase 6: Exit Date Policy Configuration

Repeat the configuration process with these specifications:

Display Title: Show Exit Date for Offboarding

Trigger Condition: Request Type is Offboarding

Action Settings:

- Target Variable: **Exit Date**
- Visibility Setting: **True** (Enabled)

Validation & Testing

- Finalize and preserve all configured UI Policies
- Open the form interface within **Service Portal**

- Verify both conditional scenarios:
 - Select **Onboarding** → Joining Date should appear.
 - Select **Offboarding** → Exit Date should appear.
-

Expected Outcome

- Dynamic form behavior based on request type.
- Reduced user input errors.
- Improved form usability and efficiency.
