

Phase 3 -- UI/UX Development & Customization

User Experience & Form Optimization

Date	2026-07-01
Project Name	Automated Employee Onboarding & Offboarding System
Author	AYUB HUSSAIN SHAIK
Organization	SKILLWALLET INTERNSHIP
Document	Usability Design

Overview

The solution enhances user experience through intelligent form field conditioning. Form fields render conditionally based on user selections, showing only contextually relevant information. This design minimizes user confusion, prevents data entry errors, and streamlines the request submission experience.

Conditional Display Mechanism

Form rendering dynamically adjusts based on **Request Type** user selection.

Scenario A: New Employee Onboarding

When users select **Request Type = Onboarding**, the form will display these fields:

- Employee Full Name
- Employee Identification Number
- Organizational Department
- Employee Commencement Date
- Supervisor/Manager Name

These fields are specifically designed to capture necessary onboarding information for new employee joiners.

Scenario B: Employee Separation

When users select **Request Type = Offboarding**, the form will display these fields:

- Employee Full Name
- Employee Identification Number
- Organizational Department
- Employee Departure Date
- Reason for Employee Separation

These fields capture specific information required during employee separation and exit procedures.

Usability Advantages

- Reduces form complexity and cognitive load for users
 - Presents only contextually appropriate information fields
 - Minimizes potential for erroneous data entry mistakes
 - Enhances overall user satisfaction with the portal interface
-

Projected Results

- Users can complete lifecycle requests more efficiently
- Form simplification reduces user frustration and errors

- Data collection becomes more precise and reliable
-
