

Phase 4 -- Data Migration, Testing & Security

Data Transfer & Storage Management

Date	2026-07-01
Project Name	Automated Employee Onboarding & Offboarding System
Author	AYUB HUSSAIN SHAIK
Organization	SKILLWALLET INTERNSHIP
Document	Data Handling

Overview

The system manages request information by persisting onboarding and offboarding details within a custom **Employee Lifecycle** data table infrastructure. This table structure maintains comprehensive records containing personnel details, request specifications, and processing status.

Service Portal form inputs from the **Onboard/Offboard Employee** catalog entry automatically transfer to **u_employee_lifecycle** table fields through Flow Designer workflow automation.

Data Persistence Architecture

Employee lifecycle information persists in the **Employee Lifecycle custom table** with connections to user profiles and catalog input variables.

Data Elements Captured

- Employee Identification
- Employee Full Name
- Organizational Department
- Manager/Supervisor Assignment
- Request Classification (Onboarding / Offboarding)
- Commencement Date
- Departure Date
- Assigned Equipment & Assets
- System Access Revocation Information
- Request Processing Status

This approach enables comprehensive tracking and analytics for lifecycle activities.

Automated Variable Transfer

Workflow automation captures service portal inputs from the **Onboard/Offboard Employee** catalog and automatically transfers them to **u_employee_lifecycle** table fields.

This mechanism ensures that every request submission automatically generates or updates a corresponding structured record.

Implementation Procedure

Step 1: Flow Engine Setup

- Access **Flow Designer** within ServiceNow
- Establish a new automation workflow for lifecycle requests

Step 2: Trigger Configuration

- Configure trigger activation on **catalog item submission events**

- Specify the target as **Onboard/Offboard Employee** catalog item

Step 3: Variable Extraction

- Integrate the **Get Catalog Variables** operation
- Extract submitted values including:
 - Employee Identification Number
 - Manager/Supervisor
 - Organizational Department
 - Commencement/Departure Dates
 - Equipment & Asset Requirements
 - System Access Parameters

Step 4: Record Creation Logic

- Integrate the **Create/Update Record** operation
- Designate **Employee Lifecycle (u_employee_lifecycle)** as target table

Step 5: Field Transfer Mapping

- Access the **Add Fields (+)** option
- Establish transfer mappings from catalog variables to table fields:
 - Employee ID → Employee ID field
 - Department → Department field
 - Manager → Manager field
 - Commencement Date → Joining Date field
 - Departure Date → Exit Date field

Projected Results

- Comprehensive storage organization for request submissions and lifecycle details
 - Automatic generation or modification of structured records on submission
 - Dependable tracking of employee lifecycle activities
 - Enhanced reporting and workflow automation capabilities
-
