

Phase 4 -- Data Migration, Testing & Security

Information Quality & Accuracy Assurance

Date	2026-07-01
Project Name	Automated Employee Onboarding & Offboarding System
Author	AYUB HUSSAIN SHAIK
Organization	SKILLWALLET INTERNSHIP
Document	Data Integrity Framework

Overview

Data quality mechanisms ensure that employee lifecycle information remains precise, standardized, and dependable throughout request processing. Validation mechanisms, automated processes, and workflow logic prevent incomplete or inaccurate data submissions.

The system enforces required fields, auto-populates standard information, validates date logic, and enforces approval completion before workflow progression.

Data Quality Mechanisms

Mandatory Field Enforcement

To prevent incomplete submissions, the following fields require entry:

- Employee Identification Number
- Request Classification
- Organizational Department
- Manager/Supervisor

These requirements ensure comprehensive employee information capture before submission.

Automatic Field Population

Designated fields automatically populate with values using **reference field lookups and dot-walking** capabilities.

Auto-populated fields include:

- Current User Session
- Manager/Supervisor Information
- Department Assignment

Automatic population reduces manual data entry requirements, decreases error rates, and streamlines form usage.

Temporal Logic Validation

Date validation rules establish logical consistency in date-based entries.

Validation checks enforced:

- **Commencement Date must precede Departure Date**
- Prohibit simultaneous onboarding and offboarding for identical employee

These rules maintain accurate lifecycle tracking.

Approval Requirement Enforcement

Requests cannot proceed to subsequent workflow stages without **manager-level approval** completion.

Flow Designer conditions enforce this requirement by:

- Requiring manager authorization
- Triggering workflow actions only upon approval completion

Quality Assurance Implementation Summary

Focus Area	Implementation Details
Information Transfer	Service portal inputs (Employee ID, Department, Timeline, Manager, Assets) map to Employee Lifecycle custom table enabling structured tracking
Permission Management	Role-based ACLs implemented with HR managing submissions, IT/Facilities/Security managing tasks, and Managers approving requests for their teams
Quality Assessment	Component testing, end-to-end integration testing, and user acceptance verification confirm request generation, authorizations, SLA tracking, messaging, and task fulfillment
Information Accuracy	Enforced required field validations, auto-populated information (Department and Manager), date logic validation, and approval requirement enforcement

Projected Results

- Accurate and consistent employee lifecycle records.
- Reduced chances of incorrect or incomplete submissions.
- Improved workflow reliability.
- Strong data governance and validation controls.
