

Phase 5 -- Deployment, Documentation & Final Presentation

Architecture & Technical Implementation Details

Date	2026-07-01
Project Name	Automated Employee Onboarding & Offboarding System
Author	AYUB HUSSAIN SHAIK
Organization	SKILLWALLET INTERNSHIP
Document	Technical Blueprint

Overview

This document defines the technical architecture, system design, and operational implementation specifics of the Automated Employee Onboarding & Offboarding solution within ServiceNow. It documents process automation patterns, data persistence structures, authorization mechanisms, and Service Level Agreement tracking that facilitate efficient employee lifecycle administration.

Architecture Components

Component 1: Process Automation Engine

Technology: ServiceNow Flow Designer

Documentation:

- Visual workflow execution documentation
- Sequential step clarifications for lifecycle processes
- Event-based flow trigger specifications from catalog submissions

Automation Sequence:

1. Capture catalog request submission event
 2. Transmit authorization request to manager
 3. Apply conditional routing logic per request type
 4. Generate task assignments for HR, IT, Facilities, Security
 5. Modify request status in Employee Lifecycle storage
 6. Distribute notifications and execute request finalization
-

Component 2: Data Field Mapping Mechanism

Service Portal inputs from the **Onboard/Offboard Employee catalog** establish mappings to the custom lifecycle table.

Information Flow Path:

Catalog Inputs → Workflow Orchestration → Employee Lifecycle Storage

Mapped Data Elements:

- Employee Identification
- Request Classification
- Department Assignment
- Manager/Supervisor
- Commencement/Departure Dates
- Equipment & Asset Requirements
- System Access Parameters

These elements automatically transfer to the lifecycle table for centralized management.

Component 3: Data Persistence Structure

A custom database table designated **u_employee_lifecycle** provides centralized record storage.

Persisted Data Elements:

- Employee Identification
- Request Classification
- Department Assignment
- Manager/Supervisor
- Commencement Date
- Departure Date
- Request Processing Status
- Task Fulfillment Status
- SLA Performance Status

Strategic Purpose:

- Unified storage location for lifecycle information
 - Comprehensive lifecycle monitoring and analytics
-

Component 4: Authorization Flow Logic

Authorization workflows are engineered within **Flow Designer**.

Authorization Requirements:

- All lifecycle requests demand **manager-level authorization**
- Authorization assignment follows the **Manager reference mapping**

Authorization Outcomes:

- **Authorization Granted** â†’ Workflow proceeds with task distribution
 - **Authorization Denied** â†’ Request status modified and workflow halts
-

Component 5: Service Level Agreement Framework

Service Level Agreements establish performance benchmarks for task completion.

Departments with SLA Tracking:

- IT Department Tasks
- Facilities Department Tasks
- Security Department Tasks

SLA Performance Indicators:

- Task initiation timestamp
 - Task completion timestamp
 - SLA threshold breach detection
 - Performance analytics and reporting
-

Projected Results

- Comprehensive architecture documentation for system design and workflow logic
 - Clear visualization of automation mechanisms and operational flow
 - Strengthened system sustainability and future expandability
-
